

Autism Spectrum Disorder Genetic Risk Assessment

Patented Technology: HK30028843

Screening of autism and neurodevelopmental disorder by gene-based Polygenic Risk Score (PRS)

- ✓ Understand risk
- ✓ Assess cognitive function
- ✓ Intervene as soon as possible
- ⚠ **Disclaimer: This is not a diagnostic test.**

What are we doing?

ASD is a complex disorder, but it can be controlled. Studies show that mutations and environmental factors could contribute to ASD. Children with ASD may exhibit behaviours like continued repetitive movements, lack of interest, difficulty in expressing emotions, and even social withdrawal.

Our kit utilizes cutting edge technologies, including GWAS and WES, to screen for genes that can help identify whether your children have ASD or not.

What will you get?

A personal ASD risk report would be received. An ASD risk score, a cognitive function profile, and recommendations for follow up intervention are included.

So your kid has been assessed as high risk. Don't worry. Intervention helps.

Our subsidiary company, WISE Development Centre, provides all-round training courses for children with different severities of ASD. We could train your kid based on the strengths and weaknesses shown in the cognitive function profile. Parental involvement is also the key to help your kid in their journey. In the long run, with love, care, and attention, we believe that your kid would unlock their full potential and enjoy life to the fullest.
